ABSTRACT: This paper introduces the term "social needs" as a kind of federal, regional and municipal needs and creates a theoretical basis for formation of organizational and economic mechanism of self-regulating system of purchase and supply of agricultural products for state needs. Unlike other similar systems, the approach we suggest aims to transform administrative forms of regulation into self-regulation mode that exists between immediate producers of agricultural products and the clients, or distributors of budgetary resources on different levels. The basis of organizational and economic mechanism and its major constituents are state regulation of reproduction process, raw materials and finished agricultural products, matching demand and supply, use of advantages of self-regulation institutes. © IDOSI Publications, 2013.
